

**Key Questions**

- What are the states of matter?
- What is a particle?
- What is a solid?
- What is a liquid?
- What is a gas?
- What happens to the particles in the water when it is being heated or cooled?
- What is a water cycle?

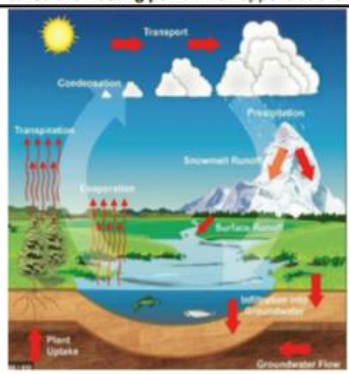

**Key people**

- Anders Celsius** (1701-1744) – a Swedish scientist who invented a scale for measuring temperature, named after him after he died.
- Daniel Fahrenheit** (1686 – 1736) – an inventor and a scientist, known for inventing the thermometer and for developing the Fahrenheit temperature scale.

**Key knowledge - What I should already know...**

Some materials are used for certain purposes because of their properties, e.g. glass for windows because it is transparent.

**Key Knowledge - What I will know by the end of this unit**

<p>What is a <b>particle</b>?</p> <ul style="list-style-type: none"> <li>● <b>Particles</b> are what materials are made from.</li> <li>● They are so small that we cannot see them with our eyes.</li> <li>● The <b>properties</b> of a substance depend on what its particles are like, how they move and how they are arranged</li> <li>● <b>Particles</b> behave differently in <b>solids, liquids and gases</b>.</li> </ul>	<ul style="list-style-type: none"> <li>● In the <b>gas</b> state, <b>particles</b> can escape from open containers.</li> <li>● <b>Gases</b> have <b>particles</b> which are spread out and move in all directions.</li> </ul>
<p>What is a <b>solid</b>?</p> <ul style="list-style-type: none"> <li>● In the <b>solid</b> state, the material holds its shape.</li> <li>● <b>Solids</b> have <b>vibrating particles</b> which are closely packed in and form a regular pattern.</li> <li>● This explains the fixed shape of a solid and why it can't be poured.</li> <li>● <b>Solids</b> always take up the same amount of space.</li> </ul>	<p>What happens to the <b>particles</b> in water when it is <b>heated</b> or <b>cooled</b>?</p> <ul style="list-style-type: none"> <li>● When water (in its <b>liquid</b> form) is <b>heated</b>, the particles start to move faster and faster until they have enough energy to move about more freely. The water has <b>evaporated</b> into a <b>water vapour</b>.</li> <li>● When water is <b>cooled</b>, the particles start to slow down until a solid structure (ice) is formed. The water has <b>frozen</b>.</li> <li>● The <b>temperature</b> at which water turns to ice is called the <b>freezing point</b>. This happens at 0°C.</li> </ul>
<p>What is a <b>liquid</b>?</p> <ul style="list-style-type: none"> <li>● In the <b>liquid</b> state, the material holds the shape of the container it is in.</li> <li>● This means that <b>liquids</b> can change shape, depending on the container.</li> <li>● <b>Liquids</b> have <b>particles</b> which are close together but random.</li> <li>● <b>Liquid particles</b> can move over each other.</li> <li>● <b>Liquids</b> can be poured.</li> </ul>	<p>knowledge organiser Geography - The Water Cycle)</p> 

**Diagram**

**Vocabulary**

Vocabulary	
condensation	small drops of water which form when <b>water vapour</b> or steam touches a <b>cold surface</b> , such as a window
cooling	lowering the <b>temperature</b> of something
evaporation	to turn from liquid into gas; pass away in the form of <b>vapour</b> .
freezing	If a <b>liquid</b> or a substance containing a <b>liquid</b> <b>freezes</b> , it becomes <b>solid</b> because of low <b>temperatures</b>
freezing point	The <b>freezing point</b> of a particular substance is the <b>temperature</b> at which it <b>freezes</b> . The <b>freezing point</b> of water is 0°C.
gas	a form of matter that is neither <b>liquid</b> nor <b>solid</b> . A <b>gas</b> rapidly spreads out when it is warmed and contracts when it is <b>cooled</b> .
heating	raising the <b>temperature</b> of something
liquid	in a form that flows easily and is neither a <b>solid</b> nor a <b>gas</b> .
melting	to change from a <b>solid</b> to a <b>liquid</b> state through heat or <b>pressure</b>
melting point	The <b>melting point</b> of a particular substance is the <b>temperature</b> at which it <b>melts</b> .
particles	a tiny amount or small piece
precipitation	rain, snow, sleet, dew, etc, formed by <b>condensation</b> of <b>water vapour</b> in the atmosphere
process	a series of actions used to produce something or reach a goal.
properties	the ways in which an object behaves
solid	having a firm shape or form that can be measured in length, width, and height; not like a <b>liquid</b> or a <b>gas</b>
temperature	a measure of how hot or cold something is
vibrations	when something <b>vibrates</b> , it shakes with repeated small, quick movements
water cycle	the <b>process</b> by which water on the earth <b>evaporates</b> , then <b>condenses</b> in the atmosphere, and then returns to earth in the form of <b>precipitation</b> .
water vapour	water in the <b>gaseous</b> state, esp when due to <b>evaporation</b> at a <b>temperature</b> below the boiling point
